

8 LEARN THE STEPS TO SPECIFYING YOUR TRANSFORMER

When you're looking to get a new transformer, drawing up the specification is by far the most crucial part. If you can specify exactly what it is you need, you can get the transformer that is ideal for your application. Get it wrong and you could be spending money where it isn't needed, or even order a transformer that's not fit for purpose. A bad specification can lead to decades of wasted energy.

That's why we created this CPD seminar, to help teach you the steps you need to take in order to avoid overspend or installing faulty equipment. Learn about how transformers have changed from a one size fits all product into something you can hone and attune to your needs, as well as how to adapt to the new non-linear grid.

This seminar is CPD certified

BOOK TODAY

This CPD seminar is free of charge and can be hosted online.

Book now by emailing marketing@wilsonpowersolutions.co.uk or by calling 0113 271 7588

Our CPD seminars are hosted free of charge and can be delivered at Wilson Power Solutions headquarters, be requested at your business premises, or be held online.

YOUR 8 STEP GUIDE TO WRITING A SPECIFICATION

WHAT SPECIFICATION APPLIES

1

Learn the importance of setting an order of precedence.

TRANSFORMER APPLICATION

2

Get to grips with what your applications requires to ensure the transformer best suits your needs.

VOLTAGE AND REGULATION

3

Understand your load and no load voltages to avoid common specification errors.

VECTOR GROUPING

4

Discover what makes vector grouping important and how they are written.

IMPEDENCE

5

Find out how to choose your impedance and the importance of getting it verified.

LOSSES

6

Understand the different types of losses and how to mitigate them.

ENVIRONMENTAL CONSIDERATIONS

7

Discover how the environment can massively influence the design.

MONITERING AND PROTECTION

8

Get to know the order of importance of the 3 methods of monitoring and protection.
